Quickly Deployable Video Surveillance System for Drop Cars and Covert Operations

Wireless Technology from AgileMesh Enables On-The-Fly Investigative Video Surveillance For Situations Where Speed and Ease-of-Use Are Critical

DALLAS, TX – September 15, 2007 - AgileMesh today announced the release of its Investigative Surveillance Kit. This system enables non-technical operators to quickly deploy and monitor surveillance in numerous covert and overt scenarios.

The base system consists of three of AgileMesh's AV4210 kits. Each of these kits is packed in a customized Pelican case and includes the core AV1210 node (transmit/receive/relay unit) with carrying pouch, a selection of appropriate antennas, two cameras – one color bullet camera and one black and white low-light pinhole camera, and power options to allow the device to run on provided battery, AC, or DC (cigarette lighter plug).

This system is designed to provide a quick, non-line-of-sight surveillance set-up. The entirely wireless, 'mesh'-based system is far more secure, flexible and rapidly-deployable than other wired or line-of-sight wireless systems. Cameras can be deployed in drop-cars, as "man-wearable," in buildings, or in any of dozens of other scenarios. If a particular situation requires use of other types of cameras, any analog or digital (IP) camera can be used instead of those provided. Monitoring (and optional recording) is done on any Windows-based laptop plugged into one of the included AV1210 nodes.

About AgileMesh, Inc.

AgileMesh, Inc. is a Texas-based corporation focused on the development of rapidly and easily deployable wireless, mesh-networked video surveillance systems. Law enforcement and other first-responders are the primary focal point of its efforts and have had (and continue to have) significant involvement in the design and development of its products. The company is backed financially by a consortium of prominent Dallas-based business leaders. AgileMesh is led by a management team with significant engineering experience in radio-frequency (RF) transmission, video technologies, product design and product development, as well as decades of business leadership experience in proprietary technology products.
